Technologies driving change

Our research has shown that industry executives agree that technology transformation will be a key driver for returning to attractive business returns. A top priority for capital markets is to streamline existing capabilities, simplify processes and increase operational efficiency.

Firms are embracing partnerships, leveraging their expertise in a shared investment model to accelerate innovation.

Four examples show how partnerships can accelerate innovation and the adoption of new technology:

1.

Cloud Computing. Third-party software-as-a-service providers offer solutions that exist on the cloud, speeding adoption of cloud infrastructure.

2.

Artificial Intelligence. Having scale and access to a large volume of transactions across multiple clients for a given function accelerates the learning and can apply this technology more quickly and deeply.

3.

Distributed Ledger Technology. DLT skills are scarce, and the technology requires multiple banks to collaborate — two things third-party partners can help with.

4.

Network Effect. Working with partners creates new networks benefiting all participants through such things as faster securities settlement and improved efficiencies in resolving open items driven by fails.

Adopting partnerships to leverage the biggest technological advances frees firms to focus on efforts that differentiate them from the competition, putting firms on a stronger pathway to profit.
